

λ = failure rate μ = Repair rate

Notes

- Correlated fail/Repair rate:
 - if X fail failure rate λ_Y increases
 - if both fail X_i, Y_i Repair rate μ_X & μ_Y degrades
- Redundancy variant:
 - only active component fail, - other activation on demand or activation taking exp. Time
- Multiple Fault Types: HW SW
- non-constant failure rate: bathtub

μ and state depends on Model

- New HW μ all same

- Technician μ Fix Component also may include μ rate because new HW
